› CODEX RESET TRACKER
Will Codex reset today?
Last verified reset + live 24h / 48h forecast
Verified history · Tibo signals · OpenAI status

About

Codex Reset is a live Codex reset prediction tracker built to answer one question quickly: did Codex reset today? It combines verified global reset timing, short-range 24-hour and 48-hour forecasts, and fresh reset signals so you can check the current outlook without digging through scattered posts. The site also includes browser-only timers, banked reset tracking, and alert options such as Telegram, Discord, email, and page alarms.

What is Codex Reset

Codex Reset is a web-based reset tracker for monitoring whether Codex has reset today

question: whether a new reset has happened yet, plus the latest verified global reset time and the current forecast window. The site describes its model as experimental and explicitly says the outlook is not above a baseline probability.

The app focuses on a narrow use case rather than general analytics:

it tracks verified global usage resets,

it shows a 24-hour and 48-hour outlook,

it surfaces banked reset status,

and it includes reminder tools for people waiting on their own Codex window.

The source material says timers stay in your browser, so the experience is lightweight and does not require an account.

Key features

Codex Reset centers its data around reset cadence, recent signals, and personal timing helpers.

Live reset status: the homepage answers whether Codex has reset today and shows the latest verified global reset timestamp.

Short-range forecast: it displays a 24-hour and 48-hour prediction, with the current model chance shown alongside a confidence label.

Historical rhythm view: the site lists past reset gaps, including an all-time median gap, last-30-days average, and recent cadence summary.

Banked reset tracking: it has a section for goodwill or banked resets, including expiry tracking and a reset guide.

Reminder and export tools: users can add a 15-minute warning, export to calendar, open a page alarm, and copy status details.

Private browser state: the usage slider and timer data stay in the browser, which keeps personal setup local.

Alert channels: the site references Telegram alerts, a Discord server, and email alerts for loud events such as resets and timed commitments.

The forecast data shown in the source includes:

model outlook: 25% in the next 24 hours,

model outlook: 40% by 48 hours,

confidence: low,

most common window: 11 PM to 2 AM UTC.

How to use it

Codex Reset works best when you match the tracker to your own `/status` output and then watch the global signal feed.

- Open the homepage and check the “Did Codex reset today?” result for the current global status.
- Read the latest verified reset time and compare it with the 24h and 48h forecast values.
- If you want a personal estimate, copy the exact time from your Codex `/status` output into the weekly window field.
- Set your usage percentage with the slider so the browser can compare your pace against the reference account.
- If you have a banked reset or future expiry, enter the exact expiry time and save it in the banked reset section.
- Use the reminder tools if you want an alarm, a 15-minute warning, or a calendar export.
- Optional: connect to the Telegram, Discord, or email alert channels if you want external notifications.

The site also provides a command-palette style workflow with actions such as saving, clearing, copying status, and opening the verified timeline.

Who it is for

Codex Reset is useful for people who care about Codex timing rather than broad AI news.

- Developers who need to know when a reset may affect their usage window.

- Users who prefer a browser-first tool with no account requirement.
- Anyone who wants a lightweight reset clock, not a full incident dashboard.

It is especially relevant if you already use the Codex client and know how to read `/status` output, since the tool asks for exact times and usage percentages from that screen.

What to know before you use it

Codex Reset is a forecasting and tracking aid, not an official OpenAI status source. The site says its model is experimental, not above baseline, and based on evidence streams rather than a combined capability score. That means the forecast can help you estimate timing, but it should not be treated as a guaranteed prediction.

A few important caveats:

- The model is described as low confidence, so near-term odds may change.
- The site uses verified reset posts and model observations, but it is not the official Codex service itself.
- Personal usage tracking depends on the exact `/status` output you paste or copy into the app.
- The browser-stored timers are local to your device, so they will not automatically sync across devices unless you use the external alert/export options.
- If you need authoritative service-health or account-specific answers, use the official OpenAI interface or your own Codex client `/status` screen.

The current historical notes also suggest there is no fixed schedule, only a rhythm. For that reason, this tracker is best for monitoring patterns, comparing recent reset gaps, and watching for the next likely signal rather than expecting a published timetable. If you want a live reset tracker for daily checking, this is the place to start, but always verify critical account details in the official source before you act on them.
